OREGON'S POPULATION FORECASTS BY AGE AND SEX

Procedure and Assumptions

Population forecasts by age and sex are developed using the cohort-component projection procedure. The population by single year of age and sex is projected based on the specific assumptions of vital events and migrations. Oregon's estimated population of July 1, 2010 based on the most recent decennial census is the base for the forecast. To explain the cohort-component projection procedure very briefly, the forecasting model "survives" the initial population distribution by age and sex to the next age-sex category in the following year, and then applies age-sex-specific birth and migration rates to the mid-year population. Further iterations subject the in-and-out migrants to the same population.

Populations by age-sex detail for the years 2000 through 2009, called intercensal estimates, in the following tables are developed by OEA based on 2000 and 2010 censuses and intercensal totals from the Population Research Center, Portland State University. The numbers of births and deaths through 2009-10 are from Oregon's Center for Health Statistics. The total populations for the period 2011 to 2020 are generated as part of the economic and revenue forecast of OEA.

Annual numbers of births are determined based on the age-specific fertility rates projected based on Oregon's past trends and past and projected national trends. Oregon's total fertility rate is assumed to remain below the replacement level of 2.1 children per woman during the forecast period, tracking at slightly lower than the national rate.

Life Table survival rates are developed for the year 2008. Male and female life expectancies for the 2010-2020 period are projected based on the past three decades of trends and national projected life expectancies. Gradual improvements in life expectancies are expected over the forecast period. At the same time, the difference between the male and female life expectancies will continue to shrink. The male life expectancy of 77.1 and the female life expectancy of 81.7 in 2010 are projected to improve to 78.5 years for males and 82.9 years for females by the year 2020.

Estimates and forecasts of the number of net migrations are based on the residuals from the difference between population change and natural increase (births minus deaths) in a given forecast period. The migration forecasting model uses Oregon's employment, unemployment rates and income/wage data from Oregon and other states. Distribution of migrants by age and sex is based on detailed data from the American Community Survey. The annual net migration between 2010 and 2020 is expected to remain in the range of 6,500 to 37,000, averaging 27,950 persons annually. Slowdown in Oregon's economy in the recent years resulted in smaller net migration and slow population growth. Estimated population growth and net migration rates in 2011 are the lowest in over two decades. This slow population growth, as a result of slow economy and high unemployment rate, is expected to continue in the near future. Migration is intrinsically related to economy and employment situation of the state. Still, current high unemployment and job loss have impacted net migration and population growth, but not to the extent in the early 1980s. Main reason for this is the fact that other states of potential destination for Oregon out-migrants are not faring any better either. Hence the potential out-migrants have very limited destination choices.

Table C.1 Population Forecasts Component of Change 1980-2020
